

# ***In-situ* observations on physical-biological variables – IMR field activities**

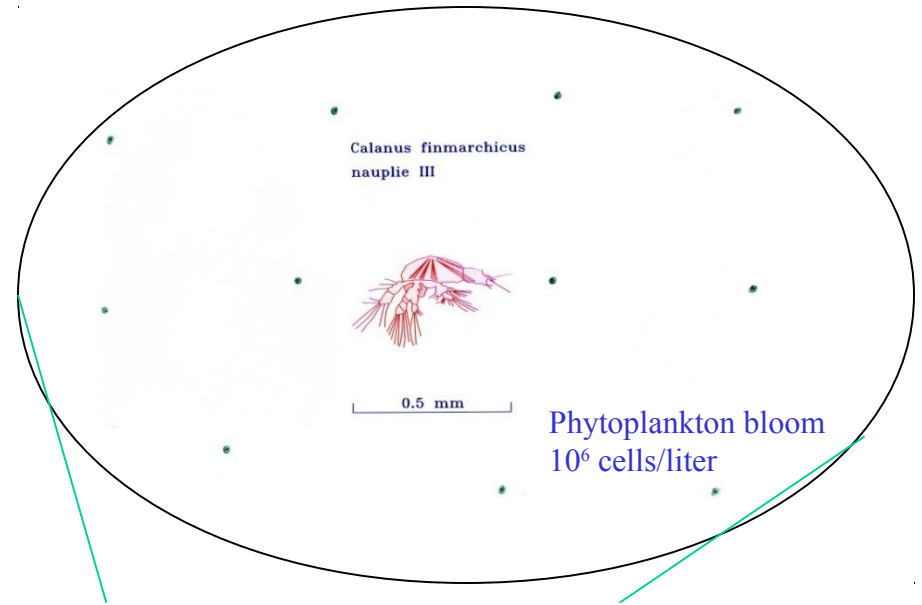

**Svein Sundby**

**Bekkjarvik Gjestgiveri  
17-19 August 2015**

**INSTITUTE OF MARINE RESEARCH  
HAVFORSKNINGSINSTITUTTET**

From the scale phytoplankton –  
to zooplankton - to fish eggs  
and larvae

## From micro- to meso-cosmic scales:

<b>Trophic level</b>	<b>Concentration</b>	<b>Separation distance</b>
Larval fish:	$\sim 1 - 10 \text{ m}^{-3}$	$\sim 1 \text{ m}$
Copepods:	$\sim 10^3 - 10^4 \text{ m}^{-3}$	$\sim 1 \text{ dm}$
Phytoplankton:	$\sim 10^9 - 10^{10} \text{ m}^{-3}$	$\sim 1 \text{ mm}$
Virus:	$\sim 10^{13} \text{ m}^{-3}$	$> 0,1 \text{ mm}$

**Lense stage**

**Cod egg**

**Embryo developing**

**Prior to hatching**

# Density gradient column for measurements of specific gravity

## The calibrated glass floats

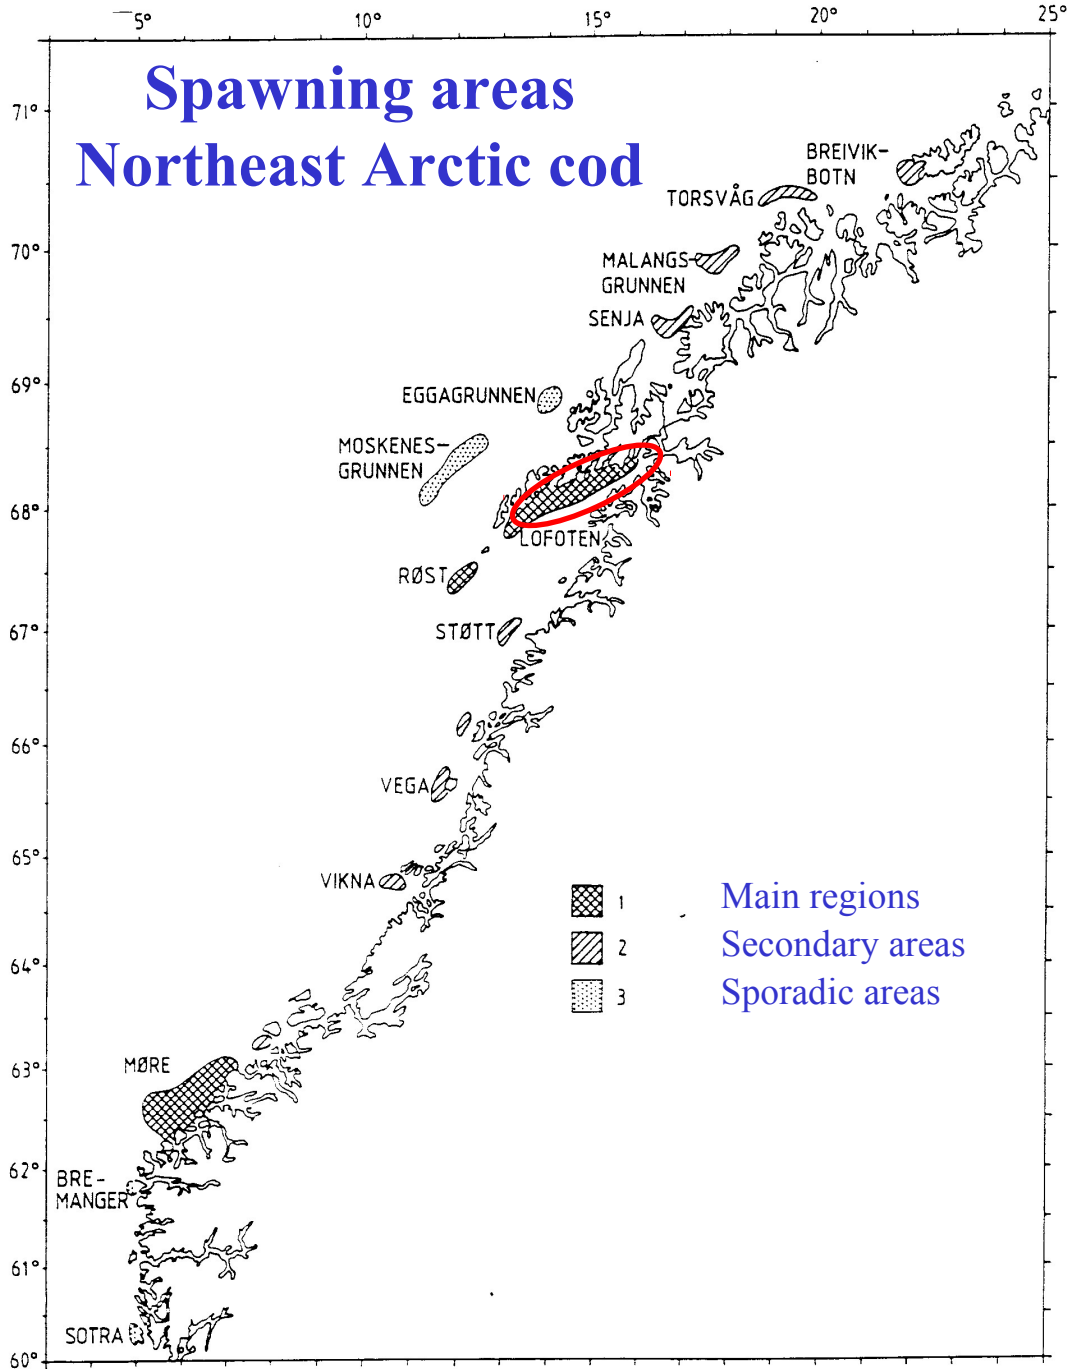

The certificate of density of the floats refers to 23°C.

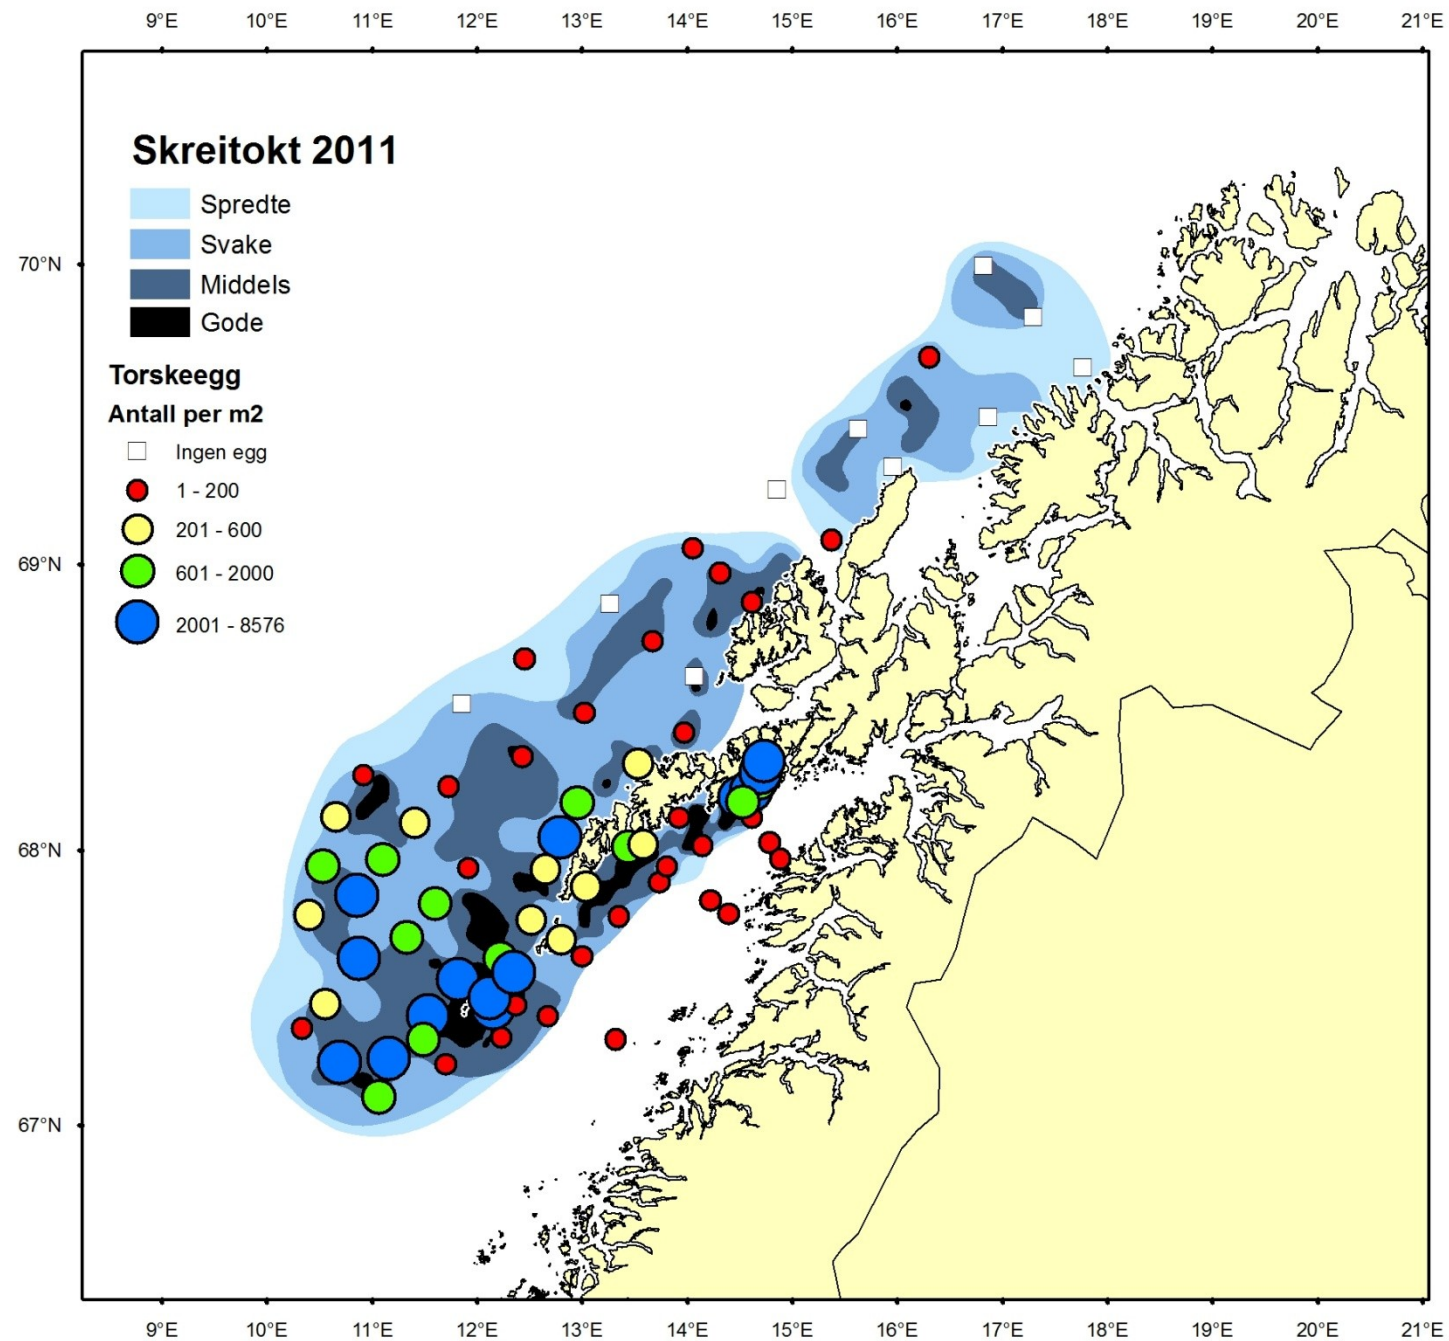

The accuracy of density is  $\pm 0,0002 \text{ g/cm}^3$ .

The density correction per 1 °C is  $0,000028 \text{ g/cm}^3$ .

# Spawning areas Northeast Arctic cod

Max. egg conc.  $\sim 10^4 \text{ m}^{-2} - 10^2 \text{ m}^{-3}$

Lofoten –NE and downwelling

# HYDROGRAPHY AND PLANKTON SAMPLING

- CTD (SeaBird)
- CTD bottles (Rosette)
- ADCP
- Fluorescence (Chl-a)
- Video plankton recorder
- Messor
- Plankton nets
  - VP2
  - Multinet (Hydrobios)
  - MOCNESS
  - Plankton pumps
- Acoustics

**Haakon Mosby**

**Johan Hjort**

**G.O. Sars**

# Video plankton recorder Vestfjorden April 2015

Falk-Petersen et al. (2015)

Hydrobios Multinet (0.25 m<sup>2</sup>, 5 nets opening/closing)

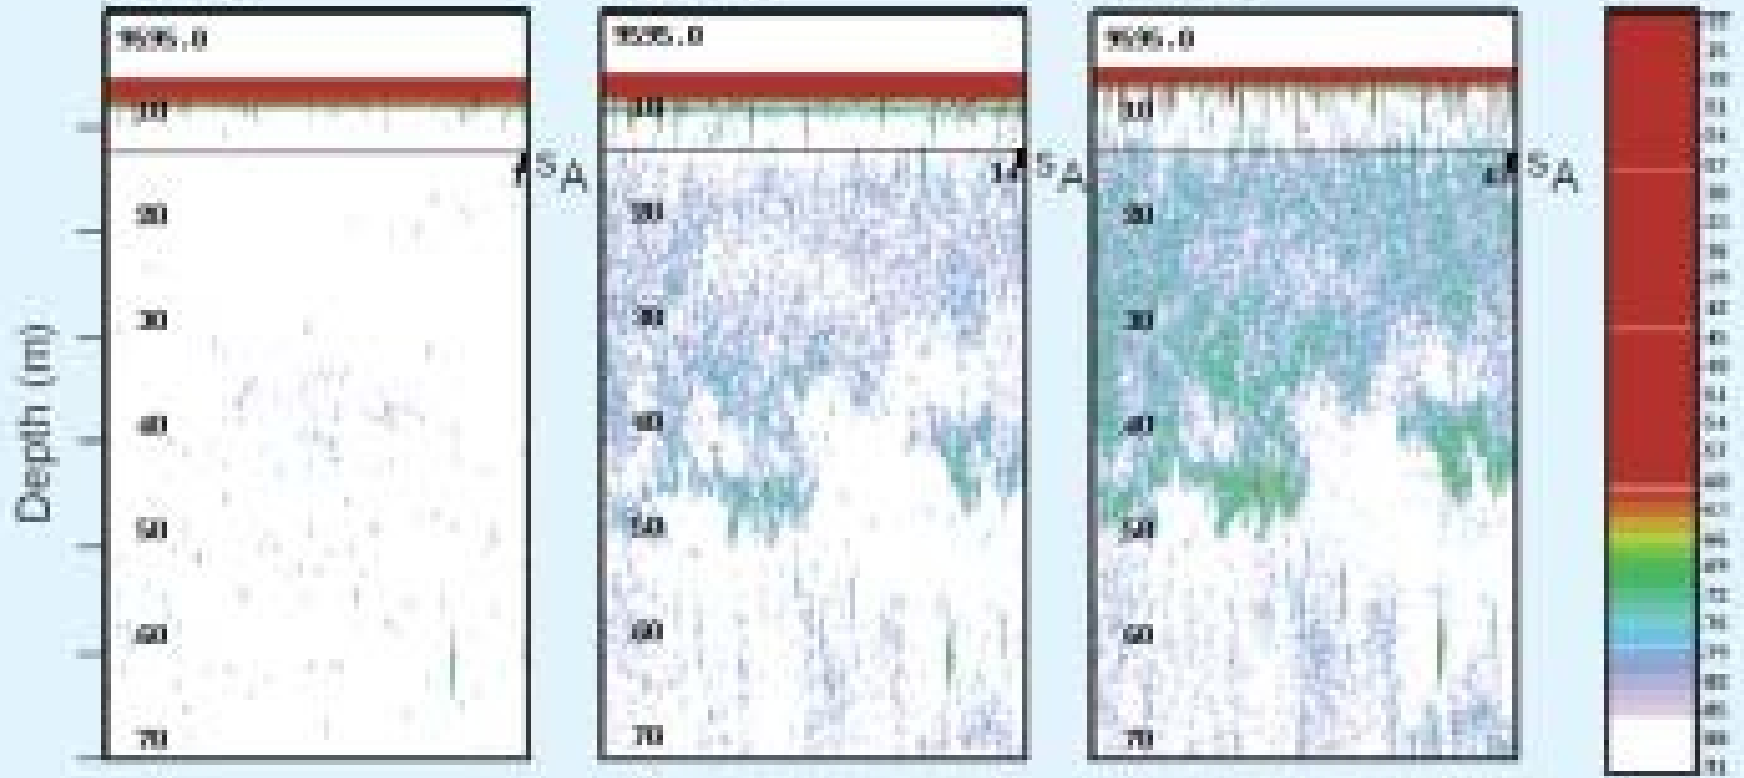

38 kHz

120 kHz

200 kHz

# Structure in fish eggs

# Structure in fish eggs

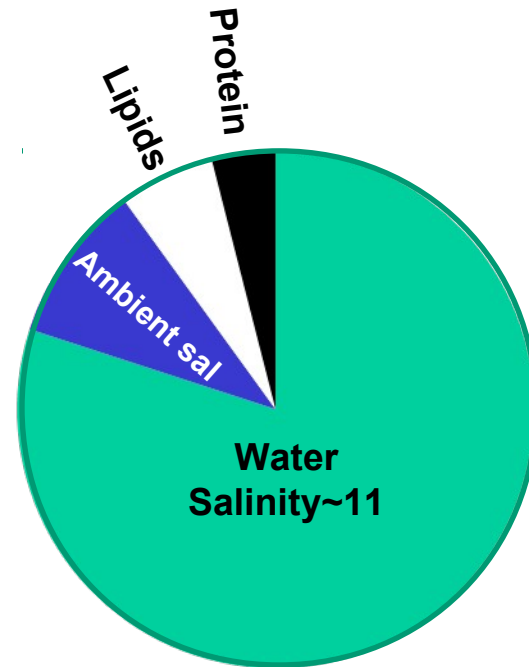

Specific gravity in the fish egg,  $\rho_e$ , is determined by the specific gravities,  $\rho_x$ , and fractional volumes,  $V_x/V_e$ , of chorion, perivitelline space, and embryo +yolk:

$$\rho_e = [(\rho_{ch} \cdot V_{ch} + \rho_{per} \cdot V_{per} + (\rho_{lip} \cdot V_{lip} + \rho_{sw} \cdot V_{per} + \rho_{pro} \cdot V_{pro}))] / V_e$$

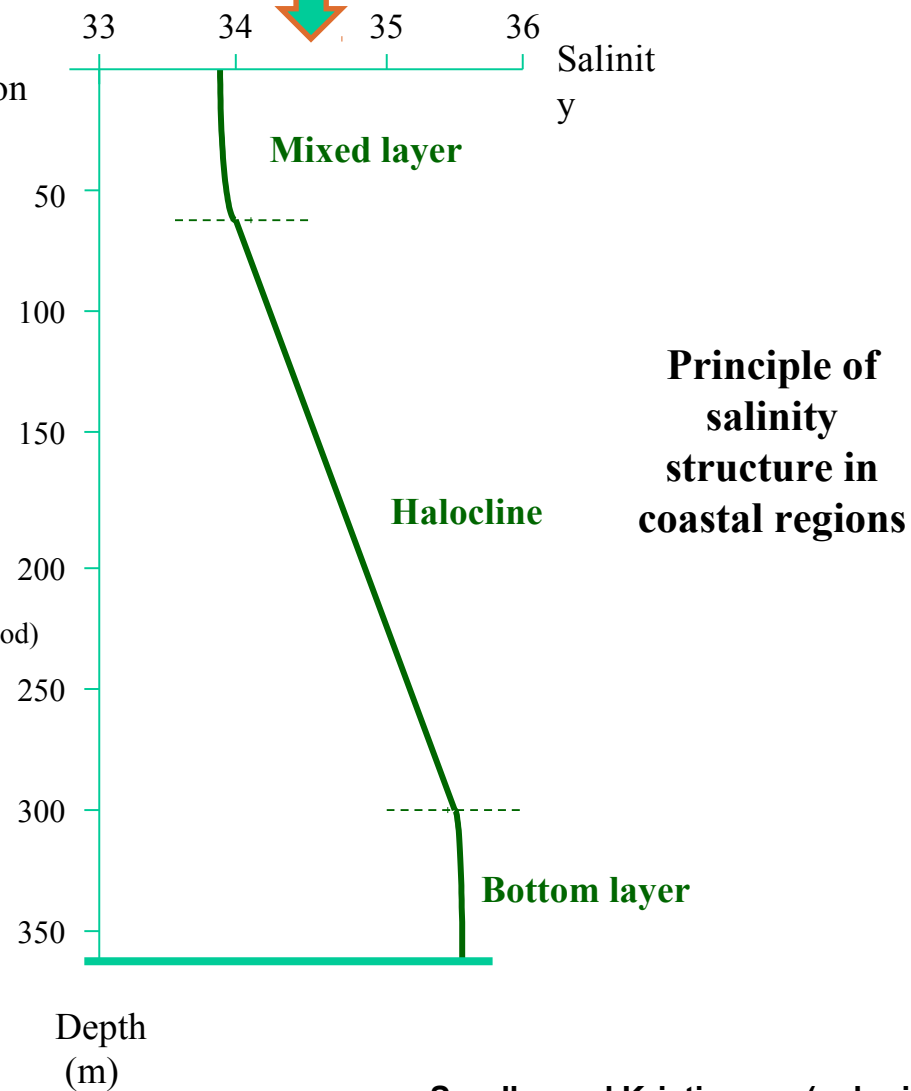

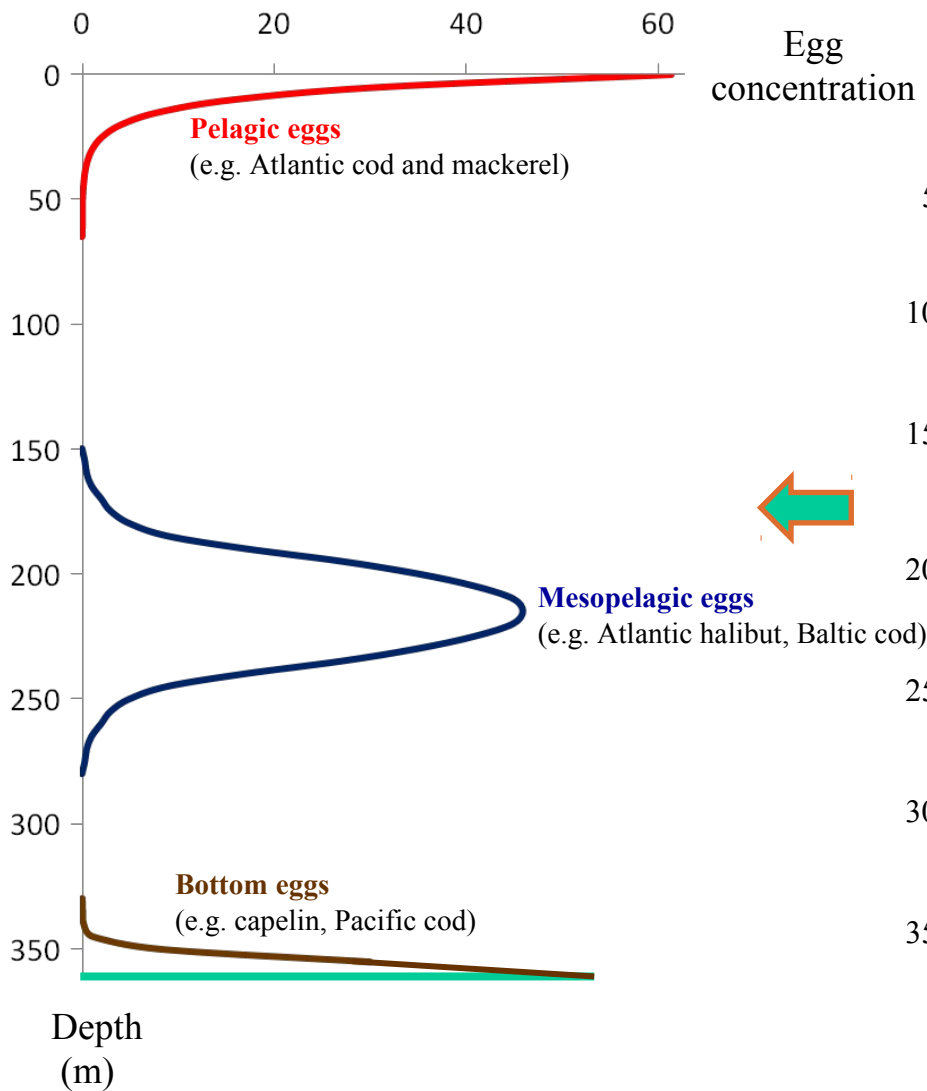

$T = 5\text{ }^{\circ}\text{C}$  **Thermal expansion**  $\rightarrow$   $T = 15\text{ }^{\circ}\text{C}$

Ambient salinity  
~ 30- 35

# Summary of Sundby (1983;1991)

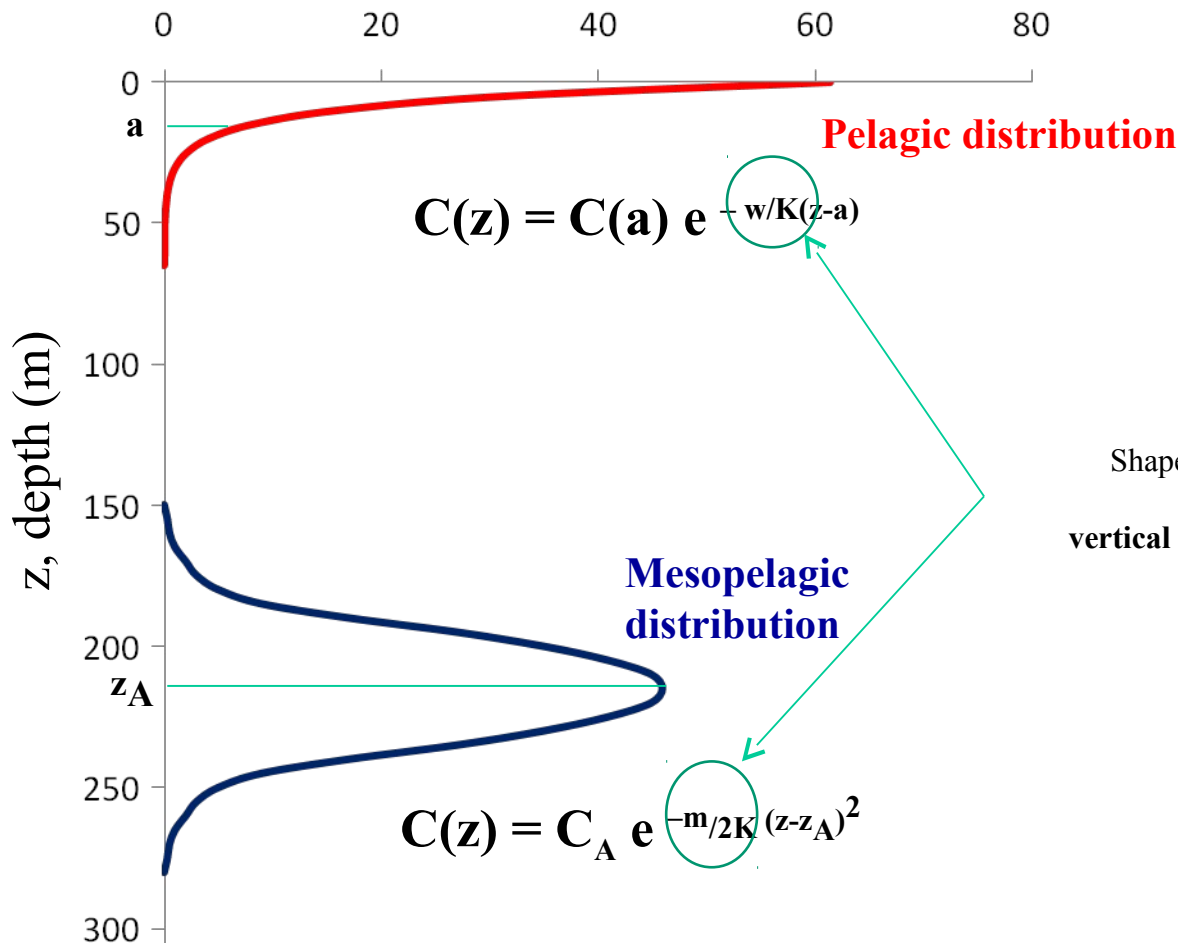

**Principle of salinity structure in coastal regions**

Basic principle - balance between **vertical diffusivity** and **egg buoyancy**:

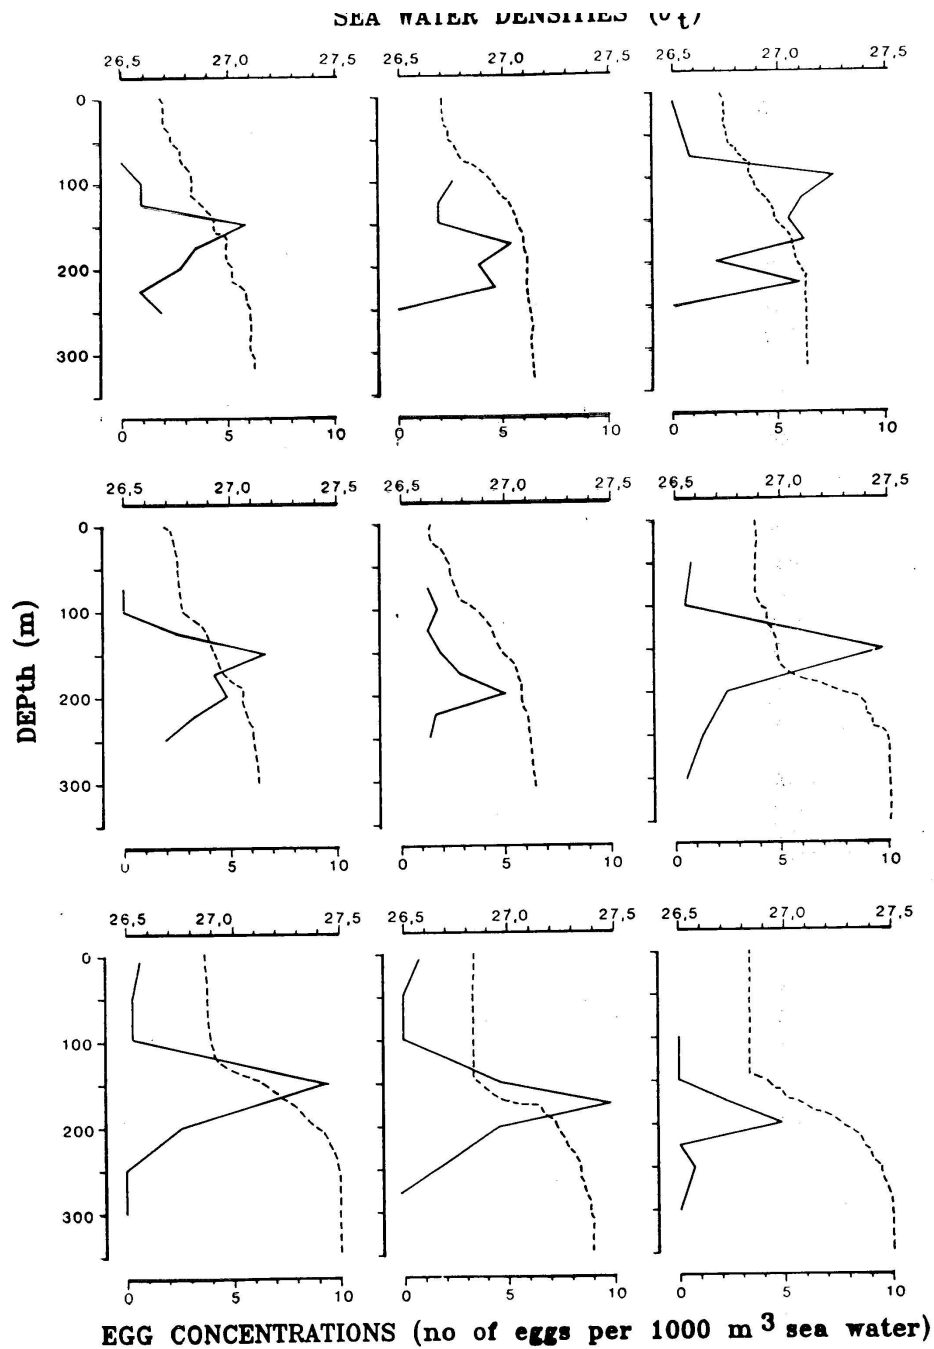

$$K(z) \cdot \partial C(z) / \partial z = - w(z) \cdot C(z)$$

$C(z)$ , egg concentration

Shape of the vertical profile determined by the ratio between vertical egg velocity,  $w$ , and eddy diffusivity,  $K$ .

Kveiteegg i Ballangen:

$$N^2 = 0.5 \times 10^{-4} - 2.0 \times 10^{-4} \text{ (s}^{-2}\text{)}$$

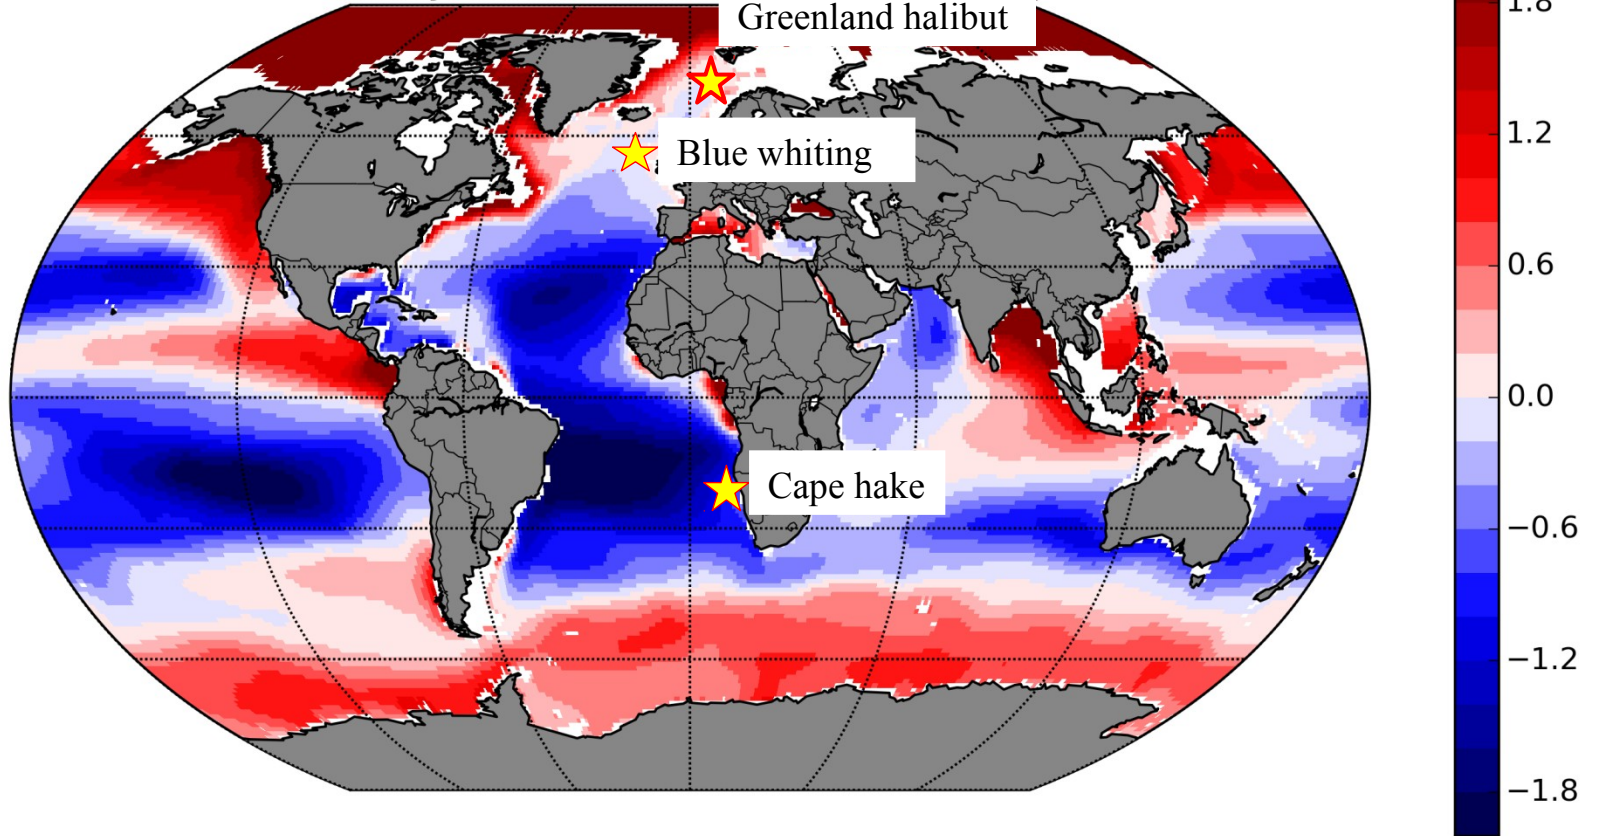

$$K_z = 0.1 - 0.5 \text{ (cm}^2 \text{ s}^{-1}\text{)}$$

⇒

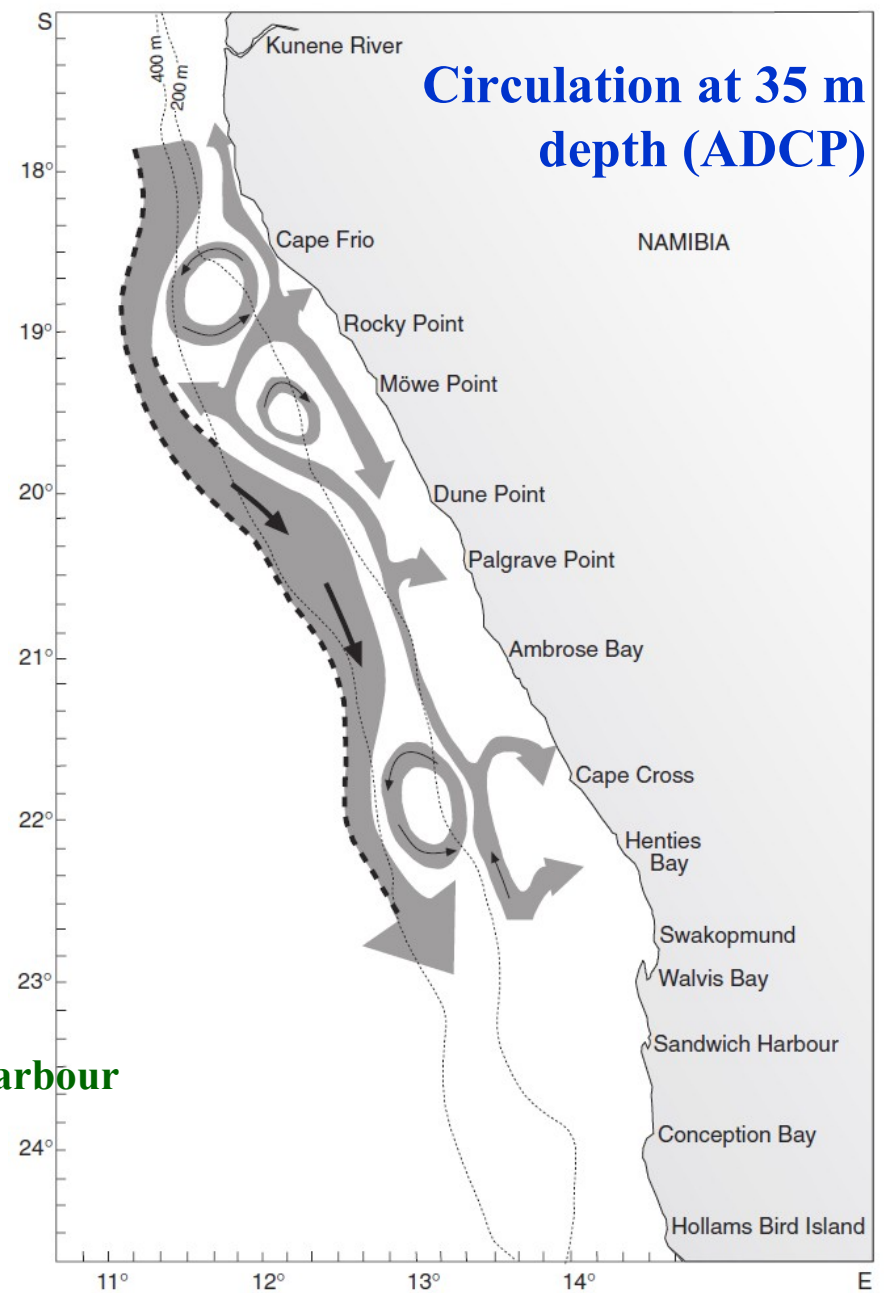

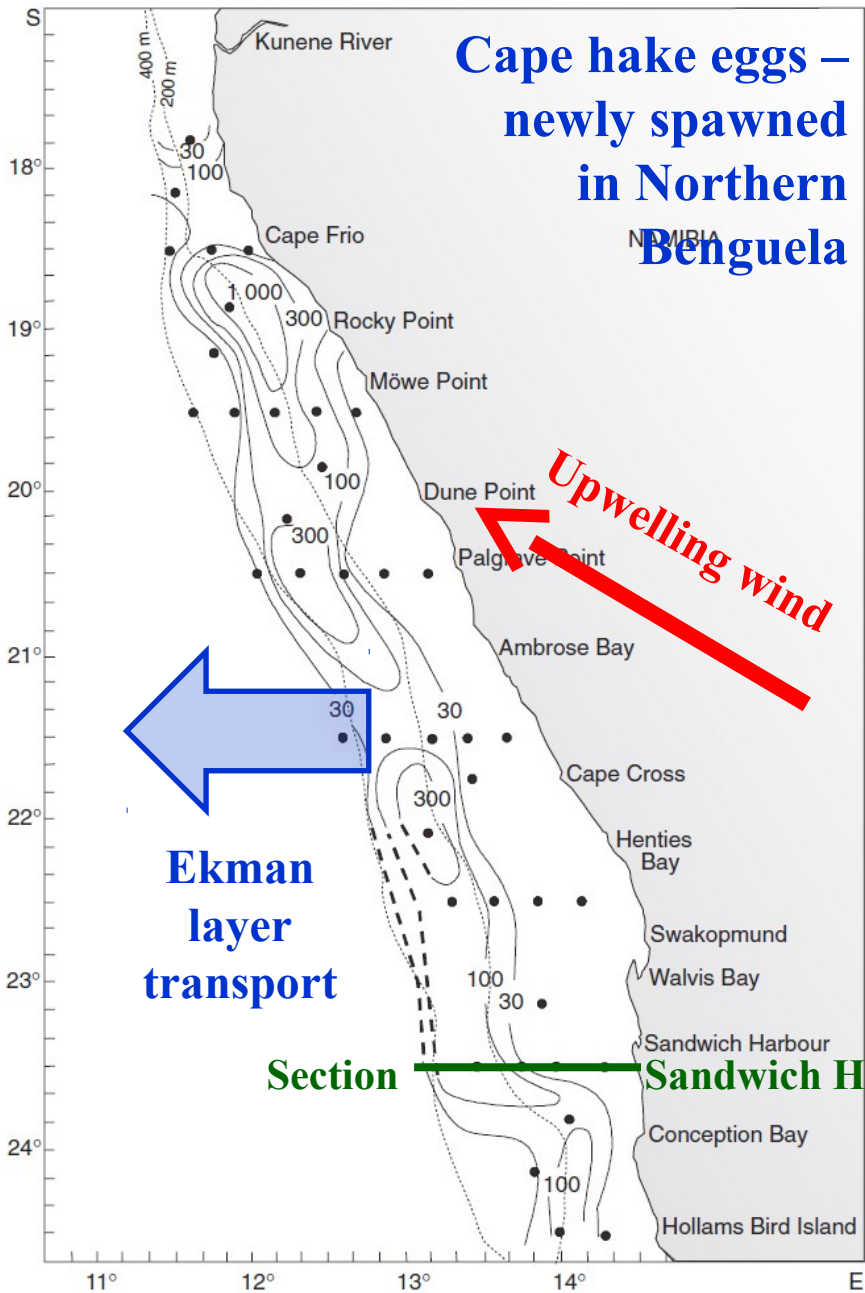

$$\sigma = 0.4 - 1.6 \text{ (m)}$$

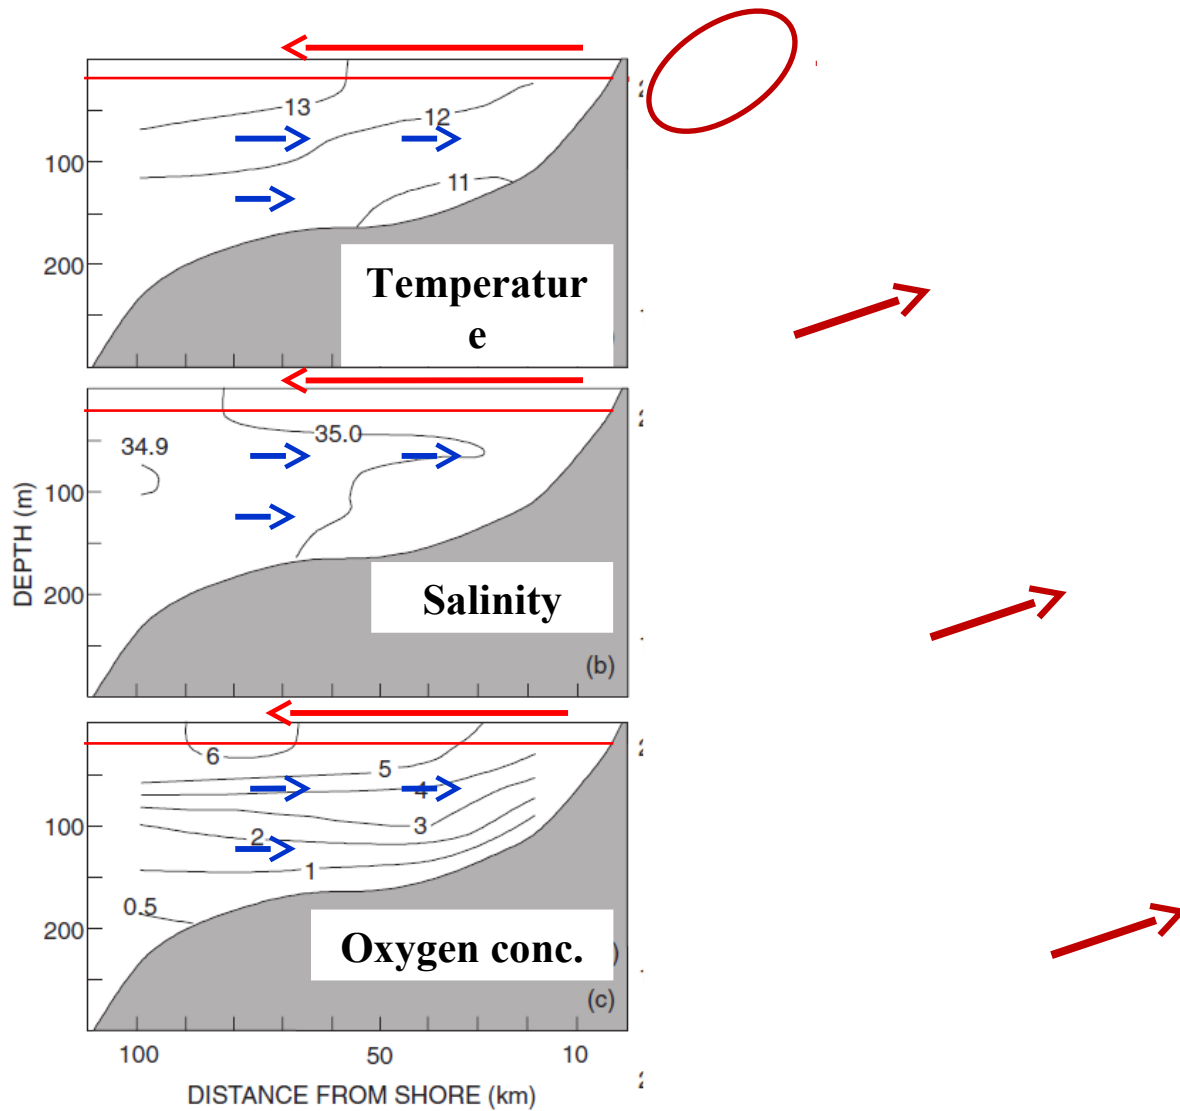

Difference in salinity between: 500m - 0m (average period: annual)

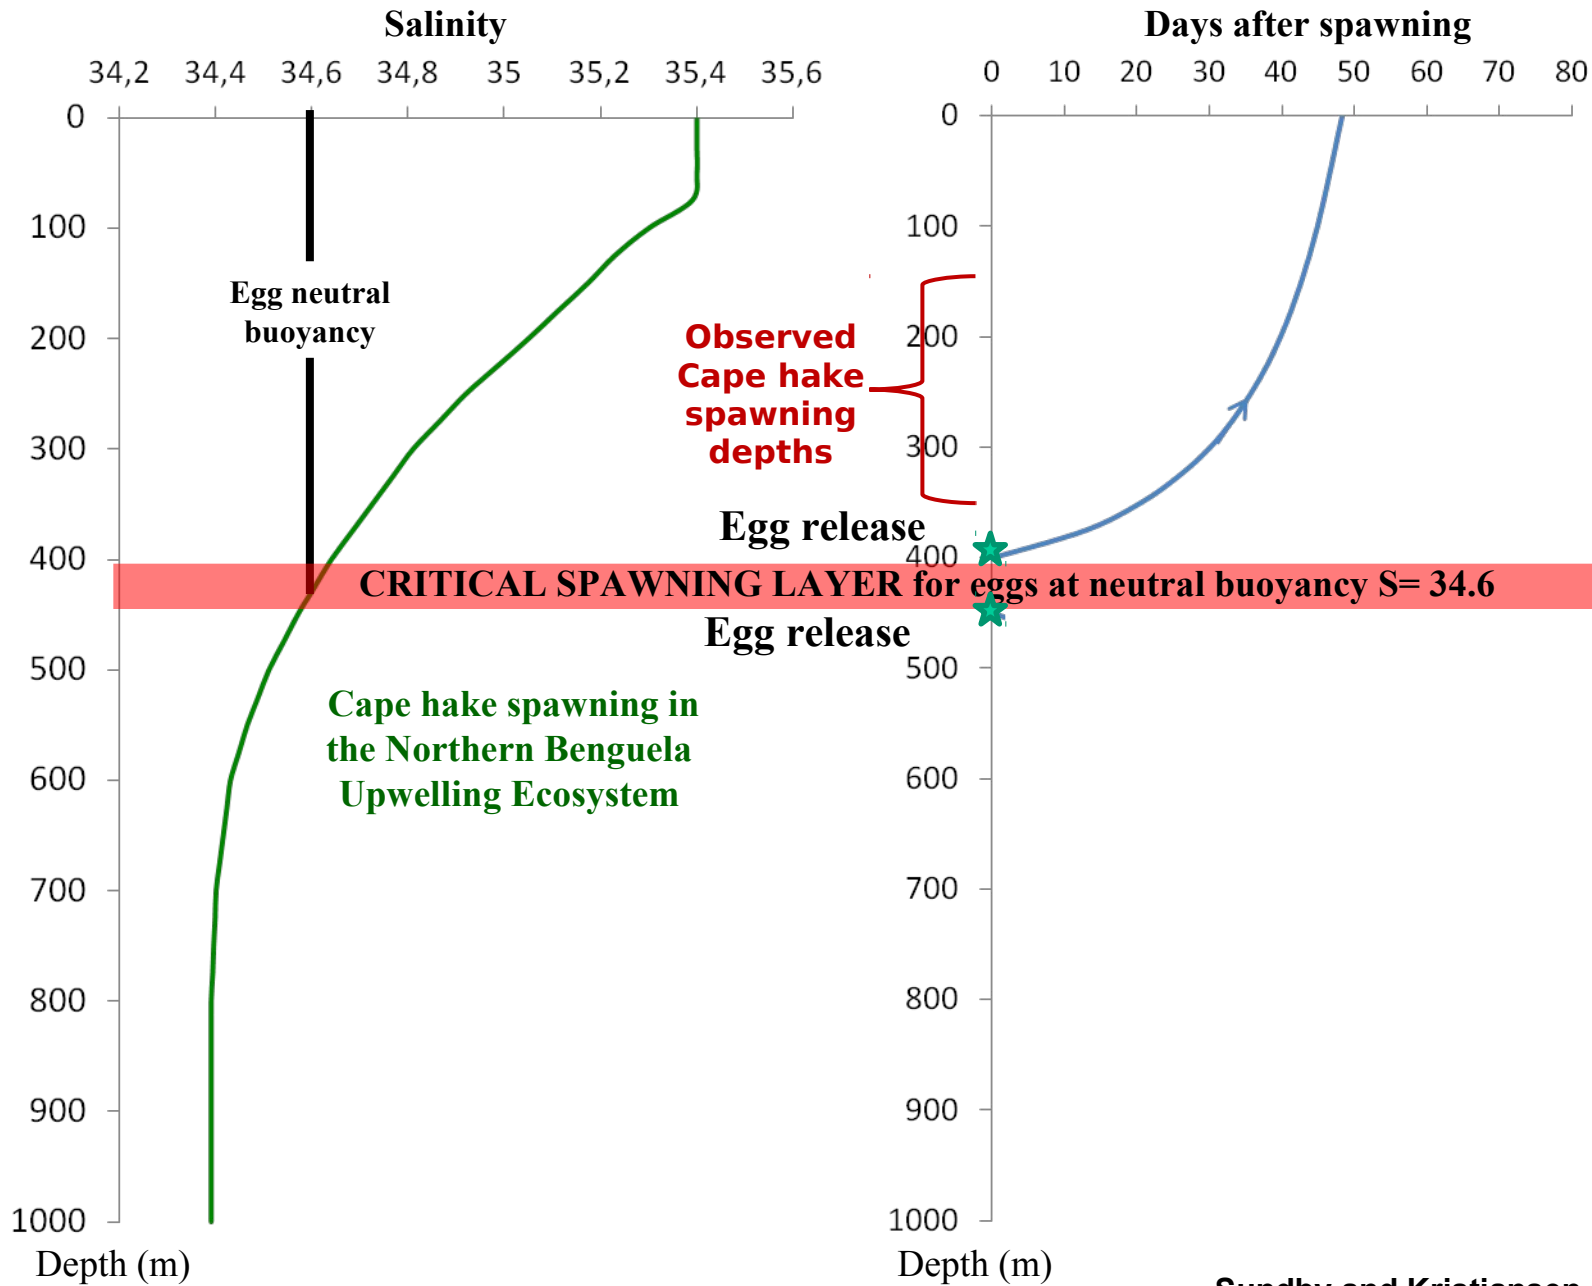

# Sandwich Harbour Section

DISTANCE FROM SHORE (km)

Sundby et al. (2001)

# Spawning area for Norwegian/Barents seas Greenland halibut

(*Reinhardtius hippoglossoides*)

Spawning depths:  
~ 500 -800 m depth

Incubation time: ~2  
month

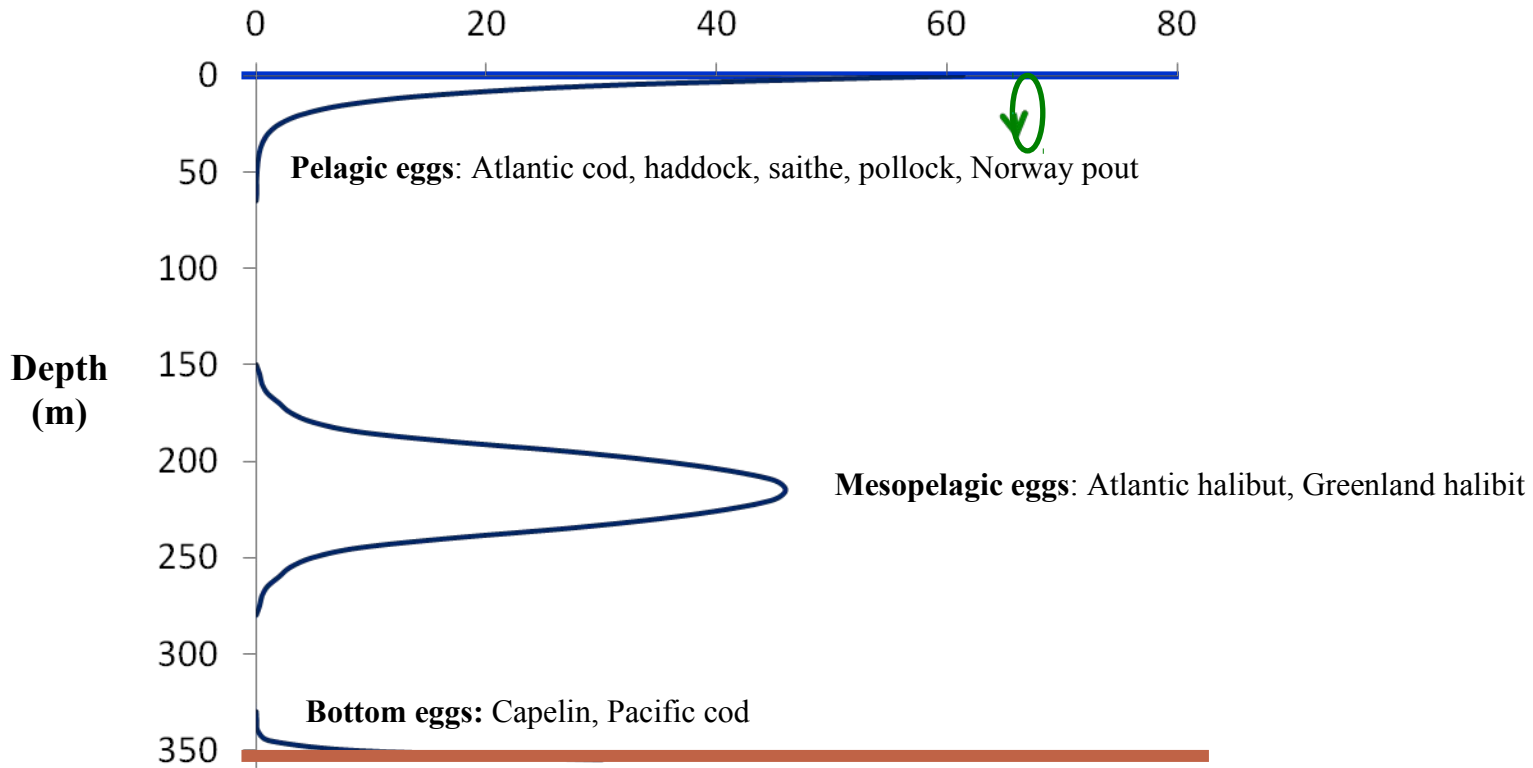

Neutral buoyancy at S =

## GOS 479 2012

# The 3 major types of vertical distributions

**Illustration 4: Mucus event in Adriatic, 1983. Giant mucus streamer in 5 m depth.  
Field of view approx. 8 m<sup>2</sup> (Stachowitsch, 1990)**

# Viscosity as a function of temperature and salinity

Seuront *et al.* (2006)

# How will a 200 % excess viscosity influence the vertical distribution of pelagic fish eggs?

Case study:

Mackerel eggs in the North Sea

Wind speed  $5 \text{ m s}^{-1}$

$$C(z) = C(a) e^{-(w/K)(z-a)} = 100 e^{-(0.0013/0.0132)z}$$

$$C(z) = 40 e^{-(0.00043/0.0132)z}$$
